

# Linear Polarizers

## Uses:

Linear polarizers are used in a wide variety of applications. A linear polarizer is an excellent solution in applications that require glare reduction due to reflected light. Camera filters, sunglasses, and machine vision systems greatly benefit from the use of a linear polarizer.

A linear polarizer can also be used to modulate the intensity of a light source. By placing two polarizers over top of each other and rotating one against the other, one can control the brightness. Aircraft cabin windows and telescope filters are ideal applications.

Photoelastic stress analysis benefits from the use of a polarizer. A polariscope can employ either a linear or circular polarizer. Transparent plastics become birefringent (double refracting) when stressed somewhat like a wave retarder. A linear or circular polarizer allows the viewer to visually see the stress patterns as evidenced by dark or isochromatic fringes.

Linear polarizers (and circular polarizers) are also used in passive 3D applications. API offers linear and circular polarized glasses and projection filters.

## Data:

### Product Code

**AP38-007T-PSA**

Description

Neutral Grey Linear Polarizer with optical PSA on one side

Thickness

.007" +/- .002"

Substrate

Cellulose Triacetate

Front Finish

Smooth, Uncoated

Back Finish

Optical Pressure Sensitive Adhesive (PSA)

Transmission-single pass

38%

Transmission-double pass, parallel

30%

Transmission-crossed

.033%

Efficiency

99.91%

Environmental

-50°C to 70°C

## Other Options:

Other front finishes: None

Other substrates: The PSA side is optimized for laminations onto Glass

Single and Parallel Transmission in Unpolarized Light

Crossed in Unpolarized Light
